LDEORB, LDEORAB, LDEORALB, LDEORLB

Atomic Exclusive-OR on byte in memory atomically loads an 8-bit byte from memory, performs an exclusive-OR with the value held in a register on it, and stores the result back to memory. The value initially loaded from memory is returned in the destination register.

- If the destination register is not WZR, `LDEORAB` and `LDEORALB` load from memory with acquire semantics.
- `LDEORLB` and `LDEORALB` store to memory with release semantics.
- `LDEORB` has neither acquire nor release semantics.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about memory accesses, see *Load/Store addressing modes*.
This instruction is used by the alias STEORB, STEORLB.

Assembler Symbols

<Ws>	Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<Wt>	Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.
<Xn|SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Alias Conditions

Alias	Is preferred when
STEORB, STEORLB	`A == '0' && Rt == '11111'`

Operation

```
bits(64) address;
bits(8) value;
bits(8) data;

AccessDescriptor accdesc = CreateAccDescAtomicOp(MemAtomicOp_EOR, acqui

value = X[s, 8];
if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n, 64];

bits(8) comparevalue = bits(8) UNKNOWN;    // Irrelevant when not execu
data = MemAtomic(address, comparevalue, value, accdesc);

if t != 31 then
    X[t, 32] = ZeroExtend(data, 32);
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
