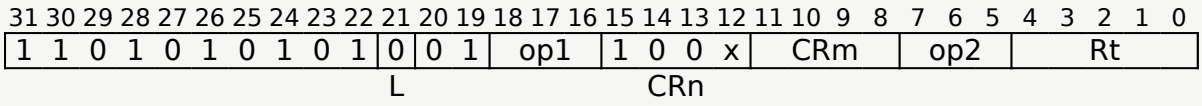
TLBIP

TLB Invalidate Pair operation.

This is an alias of SYSP. This means:

- The encodings in this description are named to match the encodings of SYSP.
- The description of SYSP gives the operational pseudocode, any constrained unpredictable behavior, and any operational information for this instruction.

System
(FEAT_D128)



```
TLBIP <tlbip_op>{, <Xt1>, <Xt2>}
```

is equivalent to

```
SYSP #<op1>, <Cn>, <Cm>, #<op2>{, <Xt1>, <Xt2>}
```

and is the preferred disassembly when `SysOp(op1,CRn,CRm,op2) == Sys_TLBIP`.

Assembler Symbols

<op1>	Is a 3-bit unsigned immediate, in the range 0 to 6, encoded in the "op1" field.
<Cn>	Is a name 'Cn', with 'n' in the range 8 to 9, encoded in the "CRn" field.
<Cm>	Is a name 'Cm', with 'm' in the range 0 to 7, encoded in the "CRm" field.
<op2>	Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

<tlbip_op>

Is a TLBIP instruction name, as listed for the TLBIP system pair instruction group, encoded in “op1:CRn:CRm:op2”:

op1	CRn	CRm	op2	<tlbip_op>	Architectural Feature

<Xt1>	Is the 64-bit name of the first optional general-purpose source register, defaulting to '11111', encoded in the "Rt" field.
<Xt2>	Is the 64-bit name of the second optional general-purpose source register, defaulting to '11111', encoded as "Rt" +1. Defaults to '11111' if "Rt" = '11111'.

Operation

The description of SYSP gives the operational pseudocode for this instruction.
