GICR_IGRPMODR<n>E, Interrupt Group Modifier Registers, n = 1 - 2

The GICR_IGRPMODR<n>E characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICR_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IGRPMODR<n>E are res0.

When GICD_CTLR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGRPMODR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifi

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGROUPR<n>E to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally unknown value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGRPMODR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_IGRPMODR<n>E is (0xD00 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR<n>E, the corresponding bit is res0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0D00 + (4 * n)	GICR_IGRPMODR<n>E

Accesses on this interface are **RW**.
