GICC_APR<n>, CPU Interface Active Priorities Registers, n = 0 - 3

The GICC_APR<n> characteristics are:

Purpose

Provides information about interrupt active priorities.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_APR<n> are res0.

The contents of these registers are implementation defined with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

When GICD_CTLR.DS == 0, these registers are Banked, and Non-secure accesses do not affect Secure operation. The Secure copies of these registers hold active priorities for Group 0 interrupts, and the Non-secure copies provide a Non-secure view of the active priorities for Group 1 interrupts.

GICC_APR1 is only implemented in implementations that support 6 or more bits of priority. GICC_APR2 and GICC_APR3 are only implemented in implementations that support 7 bits of priority.

When GICD_CTLR.DS==1, these registers hold the active priorities for Group 0 interrupts, and the active priorities for Group 1 interrupts are held by the GICC_NSAPR<n> registers.

Attributes

GICC_APR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

implementation defined.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing GICC_APR<n>

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
  - For Group 0, ICC_AP0R<n>_EL1.
  - For Group 1, ICC_AP1R<n>_EL1.
- In AArch32:
  - For Group 0, ICC_AP0R<n>.
  - For Group 1, ICC_AP1R<n>.

GICC_APR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x00D0` + (4 * n)	GICC_APR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0, accesses to this register are **RW**.
- When an access is Secure, accesses to this register are **RW**.
- When an access is Non-secure, accesses to this register are **RW**.
