

## ERXADDR\_EL1, Selected Error Record Address Register

The ERXADDR\_EL1 characteristics are:

### Purpose

Accesses [ERR<n>ADDR](#) for the error record <n> selected by [ERRSELR\\_EL1](#).SEL.

### Configuration

AArch64 System register ERXADDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXADDR\[31:0\]](#).

AArch64 System register ERXADDR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXADDR2\[31:0\]](#).

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to ERXADDR\_EL1 are undefined.

### Attributes

ERXADDR\_EL1 is a 64-bit register.

### Bits [63:0]

ERXADDR\_EL1 accesses [ERR<n>ADDR](#), where <n> is the value in [ERRSELR\\_EL1](#).SEL.

### Accessing ERXADDR\_EL1

If [ERRIDR\\_EL1](#).NUM is 0x0000 or [ERRSELR\\_EL1](#).SEL is greater than or equal to [ERRIDR\\_EL1](#).NUM, then one of the following occurs:

- An unknown error record is selected.
- ERXADDR\_EL1 is RAZ/WI.
- Direct reads and writes of ERXADDR\_EL1 are NOPs.
- Direct reads and writes of ERXADDR\_EL1 are undefined.

[ERR<n>ADDR](#) describes additional constraints that also apply when [ERR<n>ADDR](#) is accessed through ERXADDR\_EL1.

Accesses to this register use the following encodings in the System register encoding space:
