

GICV_AIAR, Virtual Machine Aliased Interrupt Acknowledge Register

The GICV_AIAR characteristics are:

Purpose

Provides the INTID of the signaled Group 1 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register [GICC_AIAR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AIAR are res0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AIAR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:25]

Reserved, res0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are res0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are res0.

The operation of this register is similar to the operation of [GICV_IAR](#). When a vPE reads this register, the corresponding [GICH_LR<n>](#).Group field is checked to determine whether the interrupt is in Group 0 or Group 1:

- If the interrupt is Group 0, the spurious INTID 1023 is returned and the interrupt is not acknowledged.
- If the interrupt is Group 1, the INTID is returned. The List register entry is updated to active state, and the appropriate bit in [GICH_APR<n>](#) is set to 1.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- When the virtual CPU interface is enabled and [GICH_HCR](#).En == 1:
 - There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
 - The highest priority pending interrupt is in Group 0.
- Interrupt signaling by the virtual CPU interface is disabled.

Accessing GICV_AIAR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_IAR1](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_IAR1_EL1](#) provides equivalent functionality.

This register is used for Group 1 interrupts only. [GICV_IAR](#) provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AIAR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|-----------|
| GIC Virtual CPU interface | 0x0020 | GICV_AIAR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0, accesses to this register are **RO**.
- When an access is Secure, accesses to this register are **RO**.

- When an access is Non-secure, accesses to this register are **RO**.
