
TLBI RVAE1, TLBI RVAE1NXS, TLB Range Invalidate by VA, EL1

The TLBI RVAE1, TLBI RVAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.

Or, if FEAT_D128 is implemented, and the entry is 128-bit a stage 1 translation table entry, if TTL is 0b00.

- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of

the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is unpredictable when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1, TLBI RVAE1NXS are undefined.

Attributes

TLBI RVAE1, TLBI RVAE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
ASID																TG	SCALE	NUM			TTL	BaseADDR										
BaseADDR																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.

0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions.
This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated
as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated
as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is
BaseADDR[48:12].

When using a 16KB translation granule, this field is
BaseADDR[50:14].

When using a 64KB translation granule, this field is
BaseADDR[52:16].

Executing TLBI RVAE1, TLBI RVAE1NXS

Accesses to this instruction use the following encodings in the System
instruction encoding space:

TLBI RVAE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0110	0b001
