

ICC_EOIR0_EL1, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

Configuration

AArch64 System register ICC_EOIR0_EL1 performs the same function as AArch32 System register [ICC_EOIR0](#).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_EOIR0_EL1 are undefined.

Attributes

ICC_EOIR0_EL1 is a 64-bit register.

Field descriptions

Bits [63:24]

Reserved, res0.

INTID, bits [23:0]

The INTID from the corresponding [ICC_IAR0_EL1](#) access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICC_CTLR_EL1](#).IDbits and [ICC_CTLR_EL3](#).IDbits. If only 16 bits are implemented, bits [23:16] of this register are res0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to [ICC_DIR_EL1](#) to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is [ICC_CTLR_EL1](#).EOImode.
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is [ICC_CTLR_EL3](#).EOImode_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
 - If the software is executing in Secure state, the bit is [ICC_CTLR_EL3](#).EOImode_EL1S.
 - If the software is executing in Non-secure state, the bit is [ICC_CTLR_EL3](#).EOImode_EL1NS.

Accessing ICC_EOIR0_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from [ICC_IAR0_EL1](#), otherwise the system behavior is unpredictable. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_EOIR0_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
