

## FCVT (widening)

Multi-vector floating-point convert from half-precision to single-precision (in-order)

Convert to single-precision from half-precision, each element of the source vector, and place the results in the double-width destination elements of the destination vectors.

This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

ID\_AA64SMFR0\_EL1.F16F16 indicates whether this instruction is implemented.

### SME2

(FEAT\_SME\_F16F16)

																															L

**FCVT { <Zd1>.S-<Zd2>.S }, <Zn>.H**

```
if !HaveSME2() || !IsFeatureImplemented(FEAT_SME_F16F16) then UNDEFINED
integer n = UInt(Zn);
integer d = UInt(Zd:'0');
```

## Assembler Symbols

- <Zd1> Is the name of the first destination scalable vector register of a multi-vector sequence, encoded as "Zd" times 2.
- <Zd2> Is the name of the second destination scalable vector register of a multi-vector sequence, encoded as "Zd" times 2 plus 1.
- <Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

## Operation

```
CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV 16;
bits(VL) operand = Z[n, VL];
bits(2*VL) result;

for e = 0 to elements-1
    bits(16) element = Elem[operand, e, 16];
```

```
bits(32) res = FPConvertSVE(element, FPCR[], 32);  
Elem[result, e, 32] = res;
```

```
Z[d+0, VL] = result<VL-1:0>;  
Z[d+1, VL] = result<2*VL-1:VL>;
```
