

ICC_BPR0_EL1, Interrupt Controller Binary Point Register 0

The ICC_BPR0_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

Configuration

AArch64 System register ICC_BPR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICC_BPR0\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_BPR0_EL1 are undefined.

Virtual accesses to this register update [ICH_VMCR_EL2.VBPR0](#).

Attributes

ICC_BPR0_EL1 is a 64-bit register.

Bits [63:3]

Reserved, res0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally unknown value.

Accessing ICC_BPR0_EL1

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is implementation defined, and reported by:

- [ICC_CTLR_EL1](#).PRIbits
- [ICC_CTLR_EL3](#).PRIbits An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

On a reset, the binary point field is unknown.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_BPR0_EL1
