

## LD1B (vector plus immediate)

Gather load unsigned bytes to vector (immediate index)

Gather load of unsigned bytes to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive elements will not cause a read from Device memory or signal faults, and are set to zero in the destination vector. This instruction is illegal when executed in Streaming SVE mode, unless FEAT\_SME\_FA64 is implemented and enabled.

It has encodings from 2 classes: [32-bit element](#) and [64-bit element](#)

### 32-bit element

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	0	0	0	1	0	0	0	1	imm5			1	1	0	Pg			Zn			Zt									
msz<1>msz<0>								U ff																							

**LD1B { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]**

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 32;
constant integer msize = 8;
boolean unsigned = TRUE;
integer offset = UInt(imm5);
```

### 64-bit element

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	0	0	0	1	0	0	0	1	imm5				1	1	0	Pg			Zn			Zt								
msz<1>msz<0>								U ff																							

**LD1B { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]**

```
if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
constant integer esize = 64;
constant integer msize = 8;
boolean unsigned = TRUE;
integer offset = UInt(imm5);
```

### Assembler Symbols

<Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

<Pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn>	Is the name of the base scalable vector register, encoded in the "Zn" field.
<imm>	Is the optional unsigned immediate byte offset, in the range 0 to 31, defaulting to 0, encoded in the "imm5" field.

## Operation

```

CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(PL) mask = P[g, PL];
bits(VL) base;
bits(VL) result;
bits(msize) data;
constant integer mbytes = msize DIV 8;
boolean contiguous = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = TRUE;
AccessDescriptor accdesc = CreateAccDescSVE(MemOp\_LOAD, nontemporal, co

if AnyActiveElement(mask, esize) then
    base = Z[n, VL];

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) then
        bits(64) addr = ZeroExtend(Elem[base, e, esize], 64) + offset *
        data = Mem[addr, mbytes, accdesc];
        Elem[result, e, esize] = Extend(data, esize, unsigned);
    else
        Elem[result, e, esize] = Zeros(esize);

Z[t, VL] = result;

```

## Operational information

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored when its governing predicate register contains the same value for each execution.
