

## STSETB, STSETLB

Atomic bit set on byte in memory, without return, atomically loads an 8-bit byte from memory, performs a bitwise OR with the value held in a register on it, and stores the result back to memory.

- STSETB does not have release semantics.
- STSETLB stores to memory with release semantics, as described in *Load-Acquire, Store-Release*.

For information about memory accesses, see *Load/Store addressing modes*.

This is an alias of [LDSETB, LDSETAB, LDSETALB, LDSETLB](#). This means:

- The encodings in this description are named to match the encodings of [LDSETB, LDSETAB, LDSETALB, LDSETLB](#).
- The description of [LDSETB, LDSETAB, LDSETALB, LDSETLB](#) gives the operational pseudocode, any constrained unpredictable behavior, and any operational information for this instruction.

### Integer (FEAT\_LSE)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
0	0	1	1	1	0	0	0	0	R	1					Rs		0	0	1	1	0	0					Rn		1	1	1	1	1
size				A								opc								Rt													

### No memory ordering (R == 0)

STSETB <Ws>, [<Xn | SP>]

is equivalent to

LDSETB <Ws>, WZR, [<Xn | SP>]

and is always the preferred disassembly.

### Release (R == 1)

STSETLB <Ws>, [<Xn | SP>]

is equivalent to

LDSETLB <Ws>, WZR, [<Xn | SP>]

and is always the preferred disassembly.

Assembler Symbols

- <Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDSETB](#), [LDSETAB](#), [LDSETALB](#), [LDSETLB](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
