

ST1W (scalar plus vector)

Scatter store words from a vector (vector index)

Scatter store of words from the active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements are not written to memory. This instruction is illegal when executed in Streaming SVE mode, unless FEAT_SME_FA64 is implemented and enabled.

It has encodings from 6 classes: [32-bit scaled offset](#) , [32-bit unpacked scaled offset](#) , [32-bit unpacked unscaled offset](#) , [32-bit unscaled offset](#) , [64-bit scaled offset](#) and [64-bit unscaled offset](#)

Assembler Symbols

- <Zt>** Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- <Pg>** Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- <Xn|SP>** Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <Zm>** Is the name of the offset scalable vector register, encoded in the "Zm" field.
- <mod>** Is the index extend and shift specifier, encoded in "xs":

xs	<mod>
0	UXTW
1	SXTW

Operation

```
CheckNonStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV esize;
bits(64) base;
bits(PL) mask = P[g, PL];
bits(VL) offset;
bits(VL) src;
constant integer mbytes = msize DIV 8;
boolean contiguous = FALSE;
boolean nontemporal = FALSE;
boolean tagchecked = TRUE;
AccessDescriptor accdesc = CreateAccDescSVE(MemOp_STORE, nontemporal, c
```

```

if !AnyActiveElement(mask, esize) then
    if n == 31 && ConstrainUnpredictableBool(Unpredictable\_CHECKSPNONEA
        CheckSPAlignment());
else
    if n == 31 then CheckSPAlignment();
    base = if n == 31 then SP[] else X[n, 64];
    offset = Z[m, VL];
    src = Z[t, VL];

for e = 0 to elements-1
    if ActivePredicateElement(mask, e, esize) then
        integer off = Int(Elem[offset, e, esize]<offs_size-1:0>, offs_unsig
            bits(64) addr = base + (off << scale);
            Mem[addr, mbytes, accdesc] = Elem[src, e, esize]<msize-1:0>;

```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then if PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored when its governing predicate register contains the same value for each execution.
