

## AFSR0\_EL2, Auxiliary Fault Status Register 0 (EL2)

The AFSR0\_EL2 characteristics are:

### Purpose

Provides additional implementation defined fault status information for exceptions taken to EL2.

### Configuration

AArch64 System register AFSR0\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HADFSR\[31:0\]](#).

If EL2 is not implemented, this register is res0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

### Attributes

AFSR0\_EL2 is a 64-bit register.

implementation defined.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally unknown value.

### Accessing AFSR0\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic AFSR0\_EL2 or AFSR0\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:
