

FADDP (scalar)

Floating-point Add Pair of elements (scalar). This instruction adds two floating-point vector elements in the source SIMD&FP register and writes the scalar result into the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in *FPCR*, the exception results in either a flag being set in *FPSR* or a synchronous exception being generated. For more information, see *Floating-point exception traps*.

Depending on the settings in the *CPACR_EL1*, *CPTR_EL2*, and *CPTR_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: [Half-precision](#) and [Single-precision and double-precision](#)

Assembler Symbols

<V>

For the half-precision variant: is the destination width specifier, encoded in "sz":

| sz | <V> |
|----|----------|
| 0 | H |
| 1 | RESERVED |

For the single-precision and double-precision variant: is the destination width specifier, encoded in "sz":

| sz | <V> |
|----|-----|
| 0 | S |
| 1 | D |

<d>

Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn>

Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T>

For the half-precision variant: is the source arrangement specifier, encoded in "sz":

| sz | <T> |
|----|----------|
| 0 | 2H |
| 1 | RESERVED |

For the single-precision and double-precision variant: is the source arrangement specifier, encoded in "sz":

| sz | <T> |
|----|-----|
| 0 | 2S |
| 1 | 2D |

Operation

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n, datasize];  
V[d, esize] = Reduce(ReduceOp_FADD, operand, esize);
```
