

UMLALT (indexed)

Unsigned multiply-add long to accumulator (top, indexed)

Multiply the odd-numbered unsigned elements within each 128-bit segment of the first source vector by the specified unsigned element in the corresponding second source vector segment and destructively add to the overlapping double-width elements of the addend vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: [32-bit](#) and [64-bit](#)

32-bit

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|-------|----|----|-----|----|----|----|----|----|-----|----|----|-----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| size<1>size<0> | | | | | | | | S U T | | | | | | | | | | | | | | | | | | | | | | | |

UMLALT <Zda>.S, <Zn>.H, <Zm>.H[<imm>]

```

if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel = 1;

```

64-bit

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|-------|----|-----|----|----|----|----|----|-----|----|----|-----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | i2h | Zm | 1 | 0 | 0 | 1 | i2l | 1 | Zn | Zda | | | | | | | | | | | | |
| size<1>size<0> | | | | | | | | S U T | | | | | | | | | | | | | | | | | | | | | | | |

UMLALT <Zda>.D, <Zn>.S, <Zm>.S[<imm>]

```

if !HaveSVE2() && !HaveSME() then UNDEFINED;
constant integer esize = 32;
integer index = UInt(i2h:i2l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel = 1;

```

Assembler Symbols

| | |
|-------|---|
| <Zda> | Is the name of the third source and destination scalable vector register, encoded in the "Zda" field. |
| <Zn> | Is the name of the first source scalable vector register, encoded in the "Zn" field. |
| <Zm> | For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field. For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field. |
| <imm> | For the 32-bit variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields. For the 64-bit variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields. |

Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV (2 * esize);
constant integer eltsperssegment = 128 DIV (2 * esize);
bits(VL) operand1 = Z[n, VL];
bits(VL) operand2 = Z[m, VL];
bits(VL) result = Z[da, VL];

for e = 0 to elements-1
    integer s = e - (e MOD eltsperssegment);
    integer element1 = UInt(Elem[operand1, 2 * e + sel, esize]);
    integer element2 = UInt(Elem[operand2, 2 * s + index, esize]);
    bits(2*esize) product = (element1 * element2) <2*esize-1:0>;
    Elem[result, e, 2*esize] = Elem[result, e, 2*esize] + product;

Z[da, VL] = result;
```

Operational information

If FEAT_SVE2 is implemented or FEAT_SME is implemented, then if PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is unpredictable:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
