

# ICV\_HPPIR0\_EL1, Interrupt Controller Virtual Highest Priority Pending Interrupt Register 0

The ICV\_HPPIR0\_EL1 characteristics are:

## Purpose

Indicates the highest priority pending virtual Group 0 interrupt on the virtual CPU interface.

## Configuration

AArch64 System register ICV\_HPPIR0\_EL1 performs the same function as AArch32 System register [ICV\\_HPPIR0](#).

This register is present only when FEAT\_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV\_HPPIR0\_EL1 are undefined.

## Attributes

ICV\_HPPIR0\_EL1 is a 64-bit register.

## Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### Bits [63:24]

Reserved, res0.

### INTID, bits [23:0]

The INTID of the highest priority pending virtual interrupt.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICV\\_CTLR\\_EL1.IDbits](#). If only 16 bits are implemented, bits [23:16] of this register are res0.

## Accessing ICV\_HPPIR0\_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC\_HPPIR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1'
    && boolean IMPLEMENTATION_DEFINED "EL3 trap priority
