SWPB, SWPAB, SWPALB, SWPLB

Swap byte in memory atomically loads an 8-bit byte from a memory location, and stores the value held in a register back to the same memory location. The value initially loaded from memory is returned in the destination register.

- If the destination register is not WZR, `SWPAB` and `SWPALB` load from memory with acquire semantics.
- `SWPLB` and `SWPALB` store to memory with release semantics.
- `SWPB` has neither acquire nor release semantics.

For more information about memory ordering semantics, see *Load-Acquire, Store-Release*.
For information about memory accesses, see *Load/Store addressing modes*.

Assembler Symbols

<Ws> Is the 32-bit name of the general-purpose register to be stored, encoded in the "Rs" field.

<Wt> Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;
bits(8) data;
bits(8) store_value;
AccessDescriptor accdesc = CreateAccDescAtomicOp(MemAtomicOp_SWP, acqui

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n, 64];

store_value = X[s, 8];

bits(8) comparevalue = bits(8) UNKNOWN;    // Irrelevant when not execu
data = MemAtomic(address, comparevalue, store_value, accdesc);

X[t, 32] = ZeroExtend(data, 32);
