Unsigned saturating increment scalar by multiple of 8-bit predicate constraint element count

Determines the number of active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the general-purpose register's unsigned integer range. The named predicate constraint limits the number of active elements in a single predicate to:

- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: <u>32-bit</u> and <u>64-bit</u>

32-bit

```
3130292827262524 23 22 212019181716151413121110 9 8 7 6 5 4 3 2 1 0

0 0 0 0 0 1 0 0 0 1 0 imm4 1 1 1 1 0 1 pattern Rdn

size<1>size<0> sf D U
```

UQINCB <Wdn>{, <pattern>{, MUL #<imm>}}

```
if ! HaveSVE() && ! HaveSME() then UNDEFINED;
constant integer esize = 8;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;
constant integer ssize = 32;
```

64-bit

```
3130292827262524 23 22 212019181716151413121110 9 8 7 6 5 4 3 2 1 0

0 0 0 0 0 1 0 0 0 1 1 imm4 1 1 1 1 0 1 pattern Rdn

size<1>size<0> sf D U
```

UQINCB <Xdn>{, <pattern>{, MUL #<imm>}}

```
if !HaveSVE() && !HaveSME() then UNDEFINED;
constant integer esize = 8;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
```

```
integer imm = <u>UInt</u>(imm4) + 1;
boolean unsigned = TRUE;
constant integer ssize = 64;
```

Assembler Symbols

<Wdn> Is the 32-bit name of the source and destination general-

purpose register, encoded in the "Rdn" field.

<Xdn> Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.

<pattern>

Is the optional pattern specifier, defaulting to ALL, encoded in "pattern":

pattern	<pre><pattern></pattern></pre>
00000	POW2
00001	VL1
00010	VL2
00011	VL3
00100	VL4
00101	VL5
00110	VL6
00111	VL7
01000	VL8
01001	VL16
01010	VL32
01011	VL64
01100	VL128
01101	VL256
0111x	#uimm5
101x1	#uimm5
10110	#uimm5
1x0x1	#uimm5
1x010	#uimm5
1xx00	#uimm5
11101	MUL4
11110	MUL3
11111	ALL

<imm>

Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
bits(ssize) operand1 = X[dn, ssize];
bits(ssize) result;

integer element1 = Int(operand1, unsigned);
(result, -) = SatQ(element1 + (count * imm), ssize, unsigned);
X[dn, 64] = Extend(result, 64, unsigned);
```
