# ICV\_HPPIR1\_EL1, Interrupt Controller Virtual Highest Priority Pending Interrupt Register 1

The ICV HPPIR1 EL1 characteristics are:

#### **Purpose**

Indicates the highest priority pending virtual Group 1 interrupt on the virtual CPU interface.

## **Configuration**

AArch64 System register ICV\_HPPIR1\_EL1 performs the same function as AArch32 System register ICV\_HPPIR1.

This register is present only when FEAT\_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV\_HPPIR1\_EL1 are undefined.

#### **Attributes**

ICV HPPIR1 EL1 is a 64-bit register.

Bits [63:24]

Reserved, res0.

#### INTID, bits [23:0]

The INTID of the highest priority pending virtual interrupt.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in <a href="ICV\_CTLR\_EL1">ICV\_CTLR\_EL1</a>. IDbits. If only 16 bits are implemented, bits [23:16] of this register are res0.

#### Accessing ICV\_HPPIR1\_EL1

Accesses to this register use the following encodings in the System register encoding space:
