## FADD (scalar)

Floating-point Add (scalar). This instruction adds the floating-point values of the two source SIMD&FP registers, and writes the result to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in *FPCR*, the exception results in either a flag being set in *FPSR*, or a synchronous exception being generated. For more information, see *Floating-point exception traps*.

Depending on the settings in the *CPACR\_EL1*, *CPTR\_EL2*, and *CPTR\_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

					op												

```
Half-precision (ftype == 11)
(FEAT_FP16)
```

```
FADD <Hd>, <Hn>, <Hm>
```

# Single-precision (ftype == 00)

```
FADD <Sd>, <Sn>, <Sm>
```

## Double-precision (ftype == 01)

```
FADD <Dd>, <Dn>, <Dm>
if ftype == '10' || (ftype == '11' && !IsFeatureImplemented(FEAT_FP16))
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
```

### **Assembler Symbols**

<dd></dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<dn></dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<dm></dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

constant integer esize = 8 << UInt(ftype EOR '10');</pre>

<hd></hd>	Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<hn></hn>	Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<hm></hm>	Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<sd></sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<sn></sn>	Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<sm></sm>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

### **Operation**

```
CheckFPEnabled64();
bits(esize) operand1 = V[n, esize];
bits(esize) operand2 = V[m, esize];

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
bits(128) result = if merge then V[n, 128] else Zeros(128);

Elem[result, 0, esize] = FPAdd(operand1, operand2, fpcr);

V[d, 128] = result;
```
