# TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI RVAAE1OS, TLBI RVAAE1OSNXS characteristics are:

## **Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - Or if FEAT\_D128 is implemented, and the entry is a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula  $[BaseADDR \le VA \le BaseADDR + ((NUM +1)*2^{(5*SCALE +1)}* Translation Granule Size)].$
- When EL2 is implemented and enabled in the current Security state:
  - If <u>HCR\_EL2</u>.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If <a href="HCR\_EL2">HCR\_EL2</a>. {E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of <u>SCR\_EL3</u>.NS if FEAT\_RME is not implemented, or <u>SCR\_EL3</u>.{NSE, NS} if FEAT\_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

#### **Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR EL3.EEL2==1, then:

- A PE with <u>SCR\_EL3</u>.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with <u>SCR\_EL3</u>.EEL2==0.
- A PE with <u>SCR\_EL3</u>.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with <u>SCR\_EL3</u>.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

#### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is unpredictable when:

- For the 4K translation granule:

  - $\circ$  If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - $\circ$  If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

For the 64K translation granule:

- $\circ$  If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## **Configuration**

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAAE1OS, TLBI RVAAE1OSNXS are undefined.

#### **Attributes**

TLBI RVAAE1OS, TLBI RVAAE1OSNXS is a 64-bit System instruction.

## Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32												
RES0	TG	SCAL	ΕN	IUM		T	TL	В	ase	a A I	DD	R
BaseADDR												
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16	15 14	13 12	11 10	9	8 7	' 6	5	4	3	2	1	0

#### Bits [63:48]

Reserved, res0.

#### **TG**, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different

translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

#### **SCALE**, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

#### NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

#### TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning			
0b00	The entries in the range can be			
	using any level for the translation			
	table entries.			
0b01	The TTL hint indicates level 1.			
	If FEAT_LPA2 is not implemented,			
	when using a 16KB translation			
	granule, this value is reserved and			
	hardware should treat this field as			
	0b00.			
0b10	The TTL hint indicates level 2.			
0b11	The TTL hint indicates level 3.			

# BaseADDR, bits [36:0] When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

#### Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

### **Executing TLBI RVAAE1OS, TLBI RVAAE1OSNXS**

Accesses to this instruction use the following encodings in the System instruction encoding space:

# TLBI RVAAE10S{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0101	0b011

```
if PSTATE.EL == ELO then
