## LDUMIN, LDUMINA, LDUMINAL, LDUMINL

Atomic unsigned minimum on word or doubleword in memory atomically loads a 32-bit word or 64-bit doubleword from memory, compares it against the value held in a register, and stores the smaller value back to memory, treating the values as unsigned numbers. The value initially loaded from memory is returned in the destination register.

- If the destination register is not one of WZR or XZR, LDUMINA and LDUMINAL load from memory with acquire semantics.
- LDUMINL and LDUMINAL store to memory with release semantics.
- LDUMIN has neither acquire nor release semantics.

For more information about memory ordering semantics, see *Load-Acquire*, *Store-Release*.

For information about memory accesses, see *Load/Store addressing modes*. This instruction is used by the alias STUMIN, STUMINL.

## **Assembler Symbols**

<ws></ws>	Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<wt></wt>	Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.
<xs></xs>	Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.
<xt></xt>	Is the 64-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.
<xn sp></xn sp>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

#### **Alias Conditions**

Alias	Is preferred when			
STUMIN, STUMINL	A == '0' && Rt == '11111'			

#### **Operation**

```
bits(64) address;
bits(datasize) value;
bits(datasize) data;
```

## **Operational information**

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
