# LDUR (SIMD&FP)

Load SIMD&FP Register (unscaled offset). This instruction loads a SIMD&FP register from memory. The address that is used for the load is calculated from a base register value and an optional immediate offset. Depending on the settings in the <code>CPACR\_EL1</code>, <code>CPTR\_EL2</code>, and <code>CPTR\_EL3</code> registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
8-bit (size == 00 && opc == 01)

LDUR <Bt>, [<Xn | SP>{, #<simm>}]

16-bit (size == 01 && opc == 01)

LDUR <Ht>, [<Xn | SP>{, #<simm>}]

32-bit (size == 10 && opc == 01)

LDUR <St>, [<Xn | SP>{, #<simm>}]

64-bit (size == 11 && opc == 01)

LDUR <Dt>, [<Xn | SP>{, #<simm>}]

128-bit (size == 00 && opc == 11)

LDUR <Qt>, [<Xn | SP>{, #<simm>}]

integer scale = UInt (opc<1>:size);
if scale > 4 then UNDEFINED;
```

### **Assembler Symbols**

<bt></bt>	Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<dt></dt>	Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
<ht></ht>	Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

bits(64) offset = SignExtend(imm9, 64);

```
Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
St>
Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
Xn|SP>
Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
simm>
Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.
```

### **Shared Decode**

```
integer n = <u>UInt</u>(Rn);
integer t = <u>UInt</u>(Rt);
<u>MemOp</u> memop = if opc<0> == '1' then <u>MemOp LOAD</u> else <u>MemOp STORE</u>;
constant integer datasize = 8 << scale;
boolean tagchecked = memop != <u>MemOp PREFETCH</u> && (n != 31);
```

## **Operation**

```
CheckFPEnabled64();
bits(64) address;
bits(datasize) data;
<u>AccessDescriptor</u> accdesc = <u>CreateAccDescASIMD</u>(memop, FALSE, tagchecked)
if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n, 64];
address = address + offset;
case memop of
    when MemOp_STORE
        data = V[t, datasize];
        Mem[address, datasize DIV 8, accdesc] = data;
    when MemOp_LOAD
        data = Mem[address, datasize DIV 8, accdesc];
        V[t, datasize] = data;
```

#### **Operational information**

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
