ST1W (scalar plus scalar, consecutive registers)

Contiguous store of words from multiple consecutive vectors (scalar index)

Contiguous store of words from elements of two or four consecutive vector registers to the memory address generated by a 64-bit scalar base and scalar index which is added to the base address. After each element access the index value is incremented, but the index register is not updated.

Inactive elements are not written to memory.

It has encodings from 2 classes: Two registers and Four registers

Two registers (FEAT_SVE2p1)

Assembler Symbols

<Zt1> For the two registers variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 2.

For the four registers variant: is the name of the first scalable vector register to be transferred, encoded as "Zt" times 4.

<Zt4> Is the name of the fourth scalable vector register to be transferred, encoded as "Zt" times 4 plus 3.

<Zt2> Is the name of the second scalable vector register to be transferred, encoded as "Zt" times 2 plus 1.

<PNg> Is the name of the governing scalable predicate register PN8-PN15, with predicate-as-counter encoding, encoded in the "PNg" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Xm> Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored when its governing predicate register contains the same value for each execution.
