## **BFADD** (predicated)

BFloat16 floating-point add vectors (predicated)

Add active BFloat16 elements of the second source vector to corresponding elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

This instruction follows SVE2.1 non-widening BFloat16 numerical behaviors. ID\_AA64ZFR0\_EL1.B16B16 indicates whether this instruction is implemented.

# SVE2 (FEAT\_SVE\_B16B16)

```
3130292827262524 23 22 212019181716151413121110 9 8 7 6 5 4 3 2 1 0

0 1 1 0 0 1 0 1 0 0 0 0 0 0 0 1 0 0 Pg Zm Zdn

size<1>size<0>
```

```
BFADD <Zdn>.H, <Pg>/M, <Zdn>.H, <Zm>.H
```

```
if (!HaveSVE2() && !HaveSME2()) |  !IsFeatureImplemented(FEAT_SVE_B16B1
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);
```

### **Assembler Symbols**

<Zdn> Is the name of the first source and destination scalable

vector register, encoded in the "Zdn" field.

<Pg> Is the name of the governing scalable predicate register P0-

P7, encoded in the "Pg" field.

<Zm> Is the name of the second source scalable vector register.

encoded in the "Zm" field.

#### Operation

```
CheckSVEEnabled();
constant integer VL = CurrentVL;
constant integer PL = VL DIV 8;
constant integer elements = VL DIV 16;
bits(PL) mask = P[g, PL];
bits(VL) operand1 = Z[dn, VL];
bits(VL) operand2 = if AnyActiveElement(mask, 16) then Z[m, VL] else Zebits(VL) result;

for e = 0 to elements-1
    bits(16) element1 = Elem[operand1, e, 16];
    if ActivePredicateElement(mask, e, 16) then
```

```
bits(16) element2 = Elem[operand2, e, 16];
    Elem[result, e, 16] = BFAdd(element1, element2, FPCR[]);
else
    Elem[result, e, 16] = element1;

Z[dn, VL] = result;
```

#### **Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is unpredictable:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
