Multi-vector signed integer convert to floating-point

Convert to single-precision from signed 32-bit integer, each element of the two or four source vectors, and place the results in the corresponding elements of the two or four destination vectors.

This instruction follows SME2 floating-point numerical behaviors corresponding to instructions that place their results in one or more SVE Z vectors.

This instruction is unpredicated.

It has encodings from 2 classes: <u>Two registers</u> and <u>Four registers</u>

Two registers (FEAT_SME2)

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 1 1 1 0 0 0 0 0 0 1 0 0 1 0 0 1 0 1 1 1 1 0 0 0 0 Zd 0
```

```
if !HaveSME2() then UNDEFINED;
integer n = UInt(Zn:'0');
integer d = UInt(Zd:'0');
constant integer nreg = 2;
boolean unsigned = FALSE;
FPRounding rounding = FPRoundingMode(FPCR[]);
```

Four registers (FEAT_SME2)

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 1 1 0 0 0 0 0 0 1 1 0 0 1 1 0 0 1 0 1 1 1 0 0 0 0 Zn 0 0 Zd 0 0
```

```
SCVTF { \langle Zd1 \rangle . S - \langle Zd4 \rangle . S }, { \langle Zn1 \rangle . S - \langle Zn4 \rangle . S }
```

```
if ! HaveSME2() then UNDEFINED;
integer n = UInt(Zn:'00');
integer d = UInt(Zd:'00');
constant integer nreg = 4;
boolean unsigned = FALSE;
FPRounding rounding = FPRoundingMode(FPCR[]);
```

Assembler Symbols

< 7.d1 >

For the two registers variant: is the name of the first destination scalable vector register of a multi-vector sequence, encoded as "Zd" times 2.

For the four registers variant: is the name of the first destination scalable vector register of a multi-vector sequence, encoded as "Zd" times 4. <Zd4>Is the name of the fourth destination scalable vector register of a multi-vector sequence, encoded as "Zd" times 4 plus 3. <Zd2> Is the name of the second destination scalable vector register of a multi-vector sequence, encoded as "Zd" times 2 plus 1. < 7.n1 >For the two registers variant: is the name of the first scalable vector register of a multi-vector sequence, encoded as "Zn" times 2. For the four registers variant: is the name of the first scalable vector register of a multi-vector sequence, encoded as "Zn" times 4. < 7.n4 >Is the name of the fourth scalable vector register of a multivector sequence, encoded as "Zn" times 4 plus 3. <Zn2>Is the name of the second scalable vector register of a multi-vector sequence, encoded as "Zn" times 2 plus 1.

Operation

```
CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV 32;
array [0..3] of bits(VL) results;

for r = 0 to nreg-1
    bits(VL) operand = Z[n+r, VL];
    for e = 0 to elements-1
        bits(32) element = Elem[operand, e, 32];
        Elem[results[r], e, 32] = FixedToFP(element, 0, unsigned, FPCR]
for r = 0 to nreg-1
    Z[d+r, VL] = results[r];
```
