# LD1H (scalar plus immediate, single register)

Contiguous load unsigned halfwords to vector (immediate index)

Contiguous load of unsigned halfwords to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not cause a read from Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes:  $\underline{16\text{-bit element}}$  ,  $\underline{32\text{-bit element}}$  and  $\underline{64\text{-bit}}$  element

### **Assembler Symbols**

<zt></zt>	Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
<pg></pg>	Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<xn sp></xn sp>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<imm></imm>	Is the optional signed immediate vector offset, in the range -8 to 7, defaulting to 0, encoded in the "imm4" field.

## **Operation**

         integer eoff = (offset * elements) + e;

         data = Mem[addr, mbytes, accdesc];
```

Elem[result, e, esize] = Extend(data, esize, unsigned);

### **Operational information**

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored when its governing predicate register contains the same value for each execution.
