Base Instructions SIMD&FP Instructions

SVE Instructions SME Instructions

FMAXNM (scalar)

Floating-point Maximum Number (scalar). This instruction compares the first and second source SIMD&FP register values, and writes the larger of the two floating-point values to the destination SIMD&FP register. Regardless of the value of *FPCR*.AH. the behavior is as follows:

- Negative zero compares less than positive zero.
- If one value is numeric and the other is a quiet NaN, the result is the numeric value.
- When *FPCR*.DN is 0, if either value is a signaling NaN or if both values are NaNs, the result is a guiet NaN.
- When *FPCR*.DN is 1, if either value is a signaling NaN or if both values are NaNs, the result is Default NaN.

This instruction can generate a floating-point exception. Depending on the settings in *FPCR*, the exception results in either a flag being set in *FPSR*, or a synchronous exception being generated. For more information, see *Floating-point exception traps*.

Depending on the settings in the *CPACR_EL1*, *CPTR_EL2*, and *CPTR_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

0 0 0 1 1 1 1 0 ftype 1 Rm 0 1 1 0 1 0 Rn Rd

op
```

```
Half-precision (ftype == 11) (FEAT_FP16)
```

```
FMAXNM <Hd>, <Hn>, <Hm>
```

Single-precision (ftype == 00)

```
FMAXNM <Sd>, <Sn>, <Sm>
```

Double-precision (ftype == 01)

```
FMAXNM <Dd>, <Dn>, <Dm>
if ftype == '10' || (ftype == '11' && !IsFeatureImplemented(FEAT_FP16))
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
constant integer esize = 8 << UInt(ftype EOR '10');</pre>
```

Assembler Symbols		
<dd></dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.	
<dn></dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.	
<dm></dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.	
<hd></hd>	Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.	
<hn></hn>	Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.	
<hm></hm>	Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.	
<sd></sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.	
<sn></sn>	Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.	
<sm></sm>	Is the 32-bit name of the second SIMD&FP source register.	

Operation

```
CheckFPEnabled64();
bits(esize) operand1 = V[n, esize];
bits(esize) operand2 = V[m, esize];

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
bits(128) result = if merge then V[n, 128] else Zeros(128);

Elem[result, 0, esize] = FPMaxNum(operand1, operand2, fpcr);
V[d, 128] = result;
```

encoded in the "Rm" field.
