## **ST1H** (scalar plus vector)

Scatter store halfwords from a vector (vector index)

Scatter store of halfwords from the active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements are not written to memory.

This instruction is illegal when executed in Streaming SVE mode, unless FEAT SME FA64 is implemented and enabled.

It has encodings from 6 classes:  $\underline{32\text{-bit}}$  scaled offset ,  $\underline{32\text{-bit}}$  unpacked scaled offset ,  $\underline{32\text{-bit}}$  unpacked unscaled offset ,  $\underline{32\text{-bit}}$  unscaled offset scaled offset and 64-bit unscaled offset

### **Assembler Symbols**

<Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<Zm> Is the name of the offset scalable vector register, encoded in

the "Zm" field.

Is the index extend and shift specifier, encoded in "xs":

### **Operational information**

If FEAT\_SVE2 is implemented or FEAT\_SME is implemented, then if PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored when its governing predicate register contains the same value for each execution.
