ICC_SGI0R_EL1, Interrupt Controller Software Generated Interrupt Group 0 Register

The ICC_SGI0R_EL1 characteristics are:

Purpose

Generates Secure Group 0 SGIs.

Configuration

AArch64 System register ICC_SGI0R_EL1 performs the same function as AArch32 System register ICC_SGI0R.

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SGI0R_EL1 are undefined.

Attributes

ICC_SGI0R_EL1 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

RES0	Aff3	RS	RES0	IRM	Aff2
RES0	INTID	Aff1	TargetList		

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bits [63:56]

Reserved, res0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is res0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is res0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a constrained unpredictable choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, res0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is res0.

Bits [31:28]

Reserved, res0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is res0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is implementation defined whether, in such cases, a Distributor can signal a system error.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is res0.

Accessing ICC_SGI0R_EL1

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARMÂ® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_SGI0R_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b111
